I. INTRODUCTION

The intent of this study is to analyze the stormwater drainage conditions that will occur as a result of the proposed assisted living and memory care building, parking facilities, and associated site improvements for the site located at 244 Old Tappan in the Borough of Old Tappan, Bergen County, New Jersey and specifically identified as Block 1606, Lot 3 on the Borough of Old Tappan Tax Maps. The majority of the site is undeveloped and contains wooded and wetlands areas. The southern portion of the site is partially developed with a barn, frame dwelling, and gravel drive.

Under proposed conditions, the site will be developed to contain one (1) assisted living and memory care building with surface level parking and associated driveway, as shown on the accompanying engineering drawings. The western portion of the lot, approximately 1.8 acres, is to remain undisturbed.

II. EXISTING DRAINAGE CONDITIONS

The overall subject site consists of 5.46 acres and contains wooded areas, wetlands, and two existing structures along the Old Tappan Road frontage.

Based on the Bergen County Soil Survey, the soil types native to the site include:

SOIL TYPE (SYMBOL)	SOIL TYPE (NAME)	HYDROLOGIC SOIL GROUP
DuuB	Dunellen-Urban land complex, 3 to 8 percent slopes	A
DuuC	Dunellen-Urban land complex, 8 to 15 percent slopes	A
RkrC	Riverhead sandy loam, 8 to 15 percent slopes	B

The site has been evaluated using the TR-55 'Urban Hydrology for Small Watersheds' standards and with the following existing drainage sub-watershed areas as depicted on the Existing Drainage Area Map:

EX-DA 1 DET.:

This study area includes the central portion of the subject property, consisting primarily of undisturbed wooded areas. Runoff generated by this area flows towards an existing depression where it is temporarily stored until it spills over and flows towards the northeast corner of the subject site, to be identified as Point of Analysis 1 (POA #1). Soils within this area belong to hydrologic group B and the time of concentration was calculated to be 16.6 minutes. The Runoff Curve Numbers, included within the Appendix of this Report, were chosen to best reflect the existing site conditions as outlined in the USDA's "Urban Hydrology for Small Watersheds: TR-55".

EX-DA 1 UNDET.:

This study area includes the northeastern portion of the subject property, consisting primarily of undisturbed wooded areas. Runoff generated by this area flows overland towards the northeast corner of the subject site, identified as Point of Analysis 1 (POA #1). Soils within this area belong to hydrologic group B and the time of concentration was calculated to be 22.2 minutes. The Runoff Curve Numbers, included within the Appendix of this Report, were chosen to best reflect the existing site conditions as outlined in the USDA's "Urban Hydrology for Small Watersheds: TR-55".

EX-DA 2:

This study area includes the western and southern majorities of the subject property, consisting primarily of undisturbed wooded areas and two (2) existing structures. The stormwater runoff generated from this area ultimately flows towards the existing on-site wetlands areas along the western property line, to be identified as Point of Analysis 2 (POA #2). The Runoff Curve Numbers, included within the Appendix of this Report, were chosen to best reflect the existing site conditions as outlined in the USDA's "Urban Hydrology for Small Watersheds: TR-55". This drainage area includes two (2) subareas identified as EX-DA-2A and EX-DA-2B, described below:

EX DA-2A: This subarea consists of the southern portion of the subject site, which is comprised of primarily wooded areas and the existing frame dwelling and barn. Runoff generated by this area flows in a southwesterly direction towards the Old Tappan Road right-of-way, is collected by existing inlets within the right-of-way, and is ultimately discharged to the wetlands areas along the western property line of the subject site. This area falls within the limits of disturbance and is subject to the runoff quantity reduction criteria set forth by the Borough of Old Tappan and NJAC 7:8. Soils within this area belong to hydrologic soil groups A and B and the time of concentration was calculated to be 18.0 minutes.

EX DA-2B: This subarea consists of the western portions of Existing Drainage Area 2, which is comprised of primarily wooded and wetlands areas. Runoff generated by this area flows towards the wetlands area, which is considered POA #2. This subarea contains areas to remain undisturbed, and is therefore exempt from the reduction criteria set forth by the Borough of Old Tappan and NJAC 7:8. Soils within this area belong to hydrologic soil groups A and B and the time of concentration was calculated to be 13.8 minutes.

III. PROPOSED DRAINAGE CONDITIONS

Under proposed conditions, the site will be developed with an assisted living and memory care building, surface level parking and associated site improvements. The existing stone dwelling will be relocated off the property and across the street for the Borough's use. The proposed improvements will result in an overall increase in impervious coverage of approximately 74,000 SF (1.7 acres). The proposed design serves to match the existing drainage patterns to the maximum extent practical. The site has been evaluated using the TR-55 'Urban Hydrology for Small Watersheds' standards and with the following proposed drainage sub-watershed areas as depicted on the Proposed Drainage Area Map:

PR-DA 1:

This area includes the majority of the subject site within the limits of development, consisting of the proposed parking areas, sidewalks, and landscaped areas. The stormwater generated from this area is collected by proposed on-site inlets and is conveyed to a proposed above-ground detention basin with sand filter (Basin #1) near the northern property line. The runoff is either infiltrated or detained and released at a controlled rate to POA #1. Soils within this study area belong to hydrologic groups A and B and the minimum time of concentration of 6 minutes was utilized for this area.

PR-DA 1 UNDET:

This area includes a portion of wooded and open space areas along the eastern and northern property lines. The stormwater generated from this area flows overland in a northeasterly direction and contributes to POA #1. A minimum time of concentration of 6 minutes has been utilized for this drainage area. Soils within this study area belong to hydrologic groups A and B.

PR-BUILDING-N:

This area includes the northern roof area of the proposed building. The stormwater generated from this area is collected and conveyed to the proposed above-ground detention basin with sand filter (Basin #1) near the northern property line of the site. The minimum time of concentration of 6 minutes has been utilized for this drainage area.

PR-DA 2:

This study area consists of wetlands to remain undisturbed and landscaped areas along the Old Tappan Road frontage. Runoff generated by the landscaped areas flows in a southwesterly direction before flowing into the existing conveyance system within the Old Tappan Road right-of-way. There it is captured by existing inlets and ultimately conveyed to the isolated wetlands in the northwest portion of the site (POA #2). Soils from this area belong to hydrologic soil groups A and B, and the runoff curve numbers, included within the Appendix of this Report, were chosen to best reflect the proposed site conditions as outlined in the USDA's "Urban

Hydrology for Small Watersheds: TR-55.” The time of concentration was calculated to be 15.2 minutes.

PR-BUILDING-S:

This area includes the southern roof area of the proposed building. The stormwater generated from this area is collected and conveyed to the proposed above-ground bioretention/detention basin (Basin #2) near the southwestern property line of the site. The minimum time of concentration of 6 minutes has been utilized for this drainage area.

IV. DESIGN METHODOLOGY

The primary design constraints for this project are based on requirements established in the Borough of Old Tappan Land Development Ordinance, New Jersey Soil Erosion and Sediment Control Standards, and NJAC 7:8. More specifically, the stormwater management design will serve to maintain existing drainage patterns to the maximum extent practical and reduce proposed runoff rates when compared to pre-development runoff rates for disturbed areas. The proposed project will disturb more than 1 acre of land and impervious surface coverage will be increased by more than ¼ acre when compared to existing conditions. As a result, the project meets the definition of a “major development” as defined NJAC 7:8. Furthermore, the project has been designed to meet green infrastructure, groundwater recharge, and water quality standards, as well as the allowable post-development peak flow rates for the disturbed area of 50%, 75% and 80% for the 2-, 10- and 100- year storms set forth by the Borough of Old Tappan and NJAC 7:8.

In order to prepare the stormwater calculations for the project, extensive initial investigation of the property and topographic survey was performed. Schwanewede/Hals Engineering was contracted to prepare an ALTA/NSPS Land Title Survey of the existing site. Based on a review of the existing site conditions and the Survey, the Drainage Area Maps for the existing and proposed conditions as defined within this report were established. The grading plan within the accompanying engineering drawings was developed for the proposed site improvements with consideration to the existing drainage patterns.

The 2-, 10- and 100-year quantity design storms are based upon the New Jersey 24 Hour Rainfall Frequency Data for Bergen County as published by the NOAA Atlas 14 Type D rainfall distribution. Curve number calculations have been included within the Appendix and are based upon hydrologic soil groups A and B. Pervious and impervious areas were modeled separately as recommended within the NJDEP Stormwater Management Best Management Practices (BMP) Manual.

The Borough of Old Tappan and NJDEP flow reduction requirements are as follows:

2-year:	50% reduction (50% of Existing)
10-year:	25% reduction (75% of Existing)
100-year:	20% reduction (80% of Existing)

V. DETENTION/INFILTRATION BASIN #1

The stormwater runoff generated by PR-DA 1 and PR-Building-N is collected by various proposed on-site inlets and conveyed to the aboveground basin located near the northern property line. The basin has been designed to accommodate the 100-year design storm, providing a maximum storage of approximately 56,500 cubic feet, and includes a sand filter to provide water quality treatment, designed in accordance with the New Jersey Stormwater Best Management Practices Manual (BMP). Runoff generated by the Water Quality Design Storm is allowed to pass through the sand filter and infiltrate into the underlying soils. Runoff volume generated by larger storm events is detained and released at a controlled rate to POA #1 through the use of an outlet control structure. Associated calculations are included in the Appendix of this report and details have been provided on the accompanying engineering drawings.

VI. BIORETENTION/DETENTION BASIN #2

The stormwater runoff generated by PR-Building-S is collected by the proposed roof leaders and conveyed through a 15" HDPE pipe to the aboveground bioretention/detention basin located near the southwestern property line. The basin has been designed to accommodate the 100-year design storm, providing a maximum storage of approximately 12,300 cubic feet. The basin has been designed as a small-scale bioretention basin to provide water quality treatment, designed in accordance with the New Jersey Stormwater Best Management Practices Manual (BMP). The roof runoff from the building is considered to be clean; however, the volume generated by the Water Quality design storm is treated and infiltrated into the underlying soils. Runoff volume generated by larger storm events is detained and released at a controlled rate to POA #2. Associated calculations are included in the Appendix of this report and details have been provided on the accompanying engineering drawings.

VII. WATER QUANTITY

As required by the Borough of Old Tappan Land Use Ordinance and NJAC 7:8, the proposed development is subject to runoff quantity reduction requirements. Two methods which may be used to achieve the runoff quantity reductions are the following:

1. Demonstrate through hydrologic and hydraulic analysis that for stormwater leaving the site, post-construction runoff hydrographs for the two-, 10-, and 100-year storm events do not exceed, at any point in time, the pre-construction runoff hydrographs for the same storm events;
2. Design stormwater management measures so that the post-construction peak runoff rates for the two-, 10-, and 100-year storm events are 50, 75, and 80 percent, respectively, of the pre-construction peak runoff rates. The percentages apply only to the post-construction stormwater runoff that is attributable to the portion of the site on which the proposed development or project is to be constructed;

The two aforementioned points of analysis have been used to analyze and ensure the satisfaction of the runoff quantity requirements using one of the above methods. POA #1 was analyzed using method 2 described above. The following table demonstrates the results of these calculations:

POA-1 (CFS)				
	Existing	Allowable	Proposed	Reduction
2-Year	0.58	0.29	0.17	70.7%
10-Year	1.71	1.28	0.55	67.8%
25-Year	2.52	N/S	0.83	67.1%
100-Year	3.85	3.08	1.25	67.5%

POA #2 was analyzed using method 1 described above. The following table represents the results of these calculations:

POA-2 (CFS)		
	Existing	Proposed
2-Year	1.37	1.14
10-Year	4.48	3.54
25-Year	6.82	5.29
100-Year	10.76	8.19

As indicated above, the peak flows for each point of analysis have been reduced when compared to existing conditions as required, thus meeting the requirements set forth in the Borough ordinance and N.J.A.C. 7:8.

VIII. WATER QUALITY

The development proposes more than one-quarter (1/4) acre of motor vehicle-traveled surface coverage and is therefore required to meet the 80% TSS removal rate requirement set forth by the Borough of Old Tappan and NJAC 7:8. Areas within Proposed Drainage Area 1 Undet. and Proposed Drainage Area 2 do not contain motor vehicle surfaces; therefore, runoff generated by these areas is are not required to be treated for water quality per NJAC 7:8.

Runoff generated by Proposed Drainage Area 1 and Building-N is conveyed to Basin 1, which includes a sand filter designed in accordance with the NJDEP BMP Manual to provide 80% TSS removal. Runoff generated by the Water Quality Design Storm is allowed to pass through the sand filter and infiltrate into the underlying soils. Runoff generated by larger storm events is detained and released at a controlled rate to POA #1 through the use of an outlet control structure.

Runoff generated by Building-S is conveyed to Basin 2, which has been designed as a small-scale bioretention basin to provide water quality treatment, designed in accordance with the NJDEP BMP Manual to provide 80% TSS removal. The runoff from the building roof is considered clean by NJAC 7:8 prior to entering the basin; however, the runoff is treated for an additional 80% TSS removal and infiltrated into the underlying soils. The maximum storage depth above the basin bottom of 1' is provided in accordance with the BMP manual and the basin is equipped with an outlet control structure to detain and release runoff from larger storm events at a controlled rate to POA #2.

IX. GROUNDWATER RECHARGE

As mentioned above, the project is considered a “major development” under the guidelines set forth by the Borough of Old Tappan and NJAC 7:8, and is therefore subject to groundwater recharge requirements set forth in same. The proposed improvements implement the previously mentioned sand filter within Basin 1, which has been designed to provide approximately 108,000 cubic feet of annual recharge volume, thus satisfying the groundwater recharge requirements.

Bioretention/detention Basin 2 has been designed to provide additional infiltration and further peak flow runoff quantity reduction under proposed conditions. Runoff generated by drainage area Building-S is conveyed to Basin 2 and allowed to infiltrate into the ground. Approximately 268,800 cubic feet of additional groundwater recharge is provided; therefore, providing a total of 376,800 cubic feet of annual recharge volume and surpassing the minimum requirement.

X. CONCLUSION

The proposed development has been designed with provisions for the safe and efficient control of stormwater runoff in a manner that will not adversely impact the existing drainage patterns, adjacent roadways, or adjacent parcels.

The stormwater management design reduces peak flow rates for the proposed development area and meets the minimum peak flow reduction for the 2, 10 and 100-year storm frequencies and/or reduces runoff to be under the curve of the existing hydrographs at all times as required by the Borough of Old Tappan and NJAC 7:8.

The water quality TSS removal requirements and groundwater recharge requirements have been satisfied by use of a sand filter and a bioretention basin, to achieve the 80% TSS required removal rate under post-development conditions.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Totals for Area of Interest			5.9	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher

Recharge Efficiency Parameters Calculations (area averages)

RWC= 4.41	(in)	DRWC= 4.41	(in)
ERWC = 0.90	(in)	EDRWC= 0.90	(in)

Procedure to fill the Pre-Development and Post-Development Conditions Tables

For each land segment, first enter the area, then select TR-55 Land Cover, then select Soil. Start from the top of the table and proceed downward. Don't leave blank rows (with A=0) in between your segment entries. Rows with A=0 will not be displayed or used in calculations. For impervious areas outside of standard lots select "Impervious Areas" as the Land Cover. Soil type for impervious areas are only required if an infiltration facility will be built within these areas.

Project Name	Description	Analysis Date	BMP or LID Type

BMP Volume	VBMP	1,859	cu.ft	dBMP Check--> OK	
				dEXC Check--> OK	

Parameters from Annual Recharge Worksheet				System Performance Calculated Parameters			
Post-D Deficit Recharge (or desired recharge volume)	Vdef	108,041	cu.ft	Annual BMP Recharge Volume		108,041	cu.ft
Post-D Impervious Area (or target Impervious Area)	Aimp	81,893	sq.ft	Avg BMP Recharge Efficiency		94.6%	Represents % Infiltration Recharged
Root Zone Water Capacity	RWC	4.24	in	%Rainfall became Runoff		78.5%	%
RWC Modified to consider dEXC	DRWC	4.24	in	%Runoff Infiltrated		43.3%	%
Climatic Factor	C-factor	1.59	no units	%Runoff Recharged		41.0%	%
Average Annual P	Pavg	49.2	in	%Rainfall Recharged		32.2%	%
Recharge Requirement over Imp. Area	dr	15.8	in				

OTHER NOTES
<p>Pdesign is accurate only after BMP dimensions are updated to make rech volume= deficit volume. The portion of BMP infiltration prior to filling and the area occupied by BMP are ignored in these calculations. Results are sensitive to dBMP, make sure dBMP selected is small enough for BMP to empty in less than 3 days. For land Segment Location of BMP if you select "impervious areas" RWC will be minimal but not zero as determined by the soil type and a shallow root zone for this Land Cover allowing consideration of lateral flow and other losses.</p>

How to solve for different recharge volumes: By default the spreadsheet assigns the values of total deficit recharge volume "Vdef" and total proposed impervious area "Aimp" from the "Annual Recharge" sheet to "Vdef" and "Aimp" on this page. This allows solution for a single BMP to handle the entire recharge requirement assuming the runoff from entire impervious area is available to the BMP. To solve for a smaller BMP or a LID-IMP to recharge only part of the recharge requirement, set Vdef to your target value and Aimp to impervious area directly connected to your infiltration facility and then solve for ABMP or dBMP. To go back to the default configuration click the "Default Vdef & Aimp" button.

OTHER NOTES

Pdesign is accurate only after BMP dimensions are updated to make rech volume= deficit volume. The portion of BMP infiltration prior to filling and the area occupied by BMP are ignored in these calculations. Results are sensitive to dBMP, make sure dBMP selected is small enough for BMP to empty in less than 3 days. For land Segment Location of BMP if you select "impervious areas" RWC will be minimal but not zero as determined by the soil type and a shallow root zone for this Land Cover allowing consideration of lateral flow and other losses.

How to solve for different recharge volumes: By default the spreadsheet assigns the values of total deficit recharge volume "Vdef" and total proposed impervious area "Aimp" from the "Annual Recharge" sheet to "Vdef" and "Aimp" on this page. This allows solution for a single BMP to handle the entire recharge requirement assuming the runoff from entire impervious area is available to the BMP.

To solve for a smaller BMP or a LID-IMP to recharge only part of the recharge requirement, set Vdef to your target value and Aimp to impervious area directly connected to your infiltration facility and then solve for ABMP or dBMP. To go back to the default configuration click the "Default Vdef & Aimp" button.

SAND FILTER CALCULATIONS

Sand Filter Sizing Calculations

Project:	CSH Old Tappan	Calculated By:	DRL
Municipality:	Old Tappan	Checked By:	DTS
Job #:	1423-99-006	Date:	3/23/2022

Basin 1

Design Storm Analyzed:	1-Year Water Quality
Tributary Drainage Area (AC):	2.44
Water Quality Design Storm Runoff Volume (CFS):	6,269
Required Forebay Storage - Total (cu ft):	627
Proposed Forebay Volume - Total (cu ft):	840
Proposed Sand Filter Storage Depth (ft):	1.35
<i>2' Max Storage Depth for WQDS</i>	
Min. Sand Surface Area per GWR Spreadsheet (SF):	1,377
Proposed Sand Filter Surface Area (SF):	4,170
Drain Time = (WQDS Volume)/(Sand Surface Area)(Sand Permeability)	< 36 Hours
Proposed Drain Time:	9.0 <36 Hours

EMERGENCY SPILLWAY CALCULATIONS

EMERGENCY SPILLWAY CALCULATIONS

Detention Basin with Sand Filter 1

o Spillway Capacity:

Spillway calculation based on weir equation: $Q = CLH^{3/2}$

'C' = weir coefficient: Use 2.61

Qmax through spillway = 7.3

Spillway designed to pass 100 year flow

100-year flow = 14.57 CFS HEADWATER DEPTH = 0.48 FT.

ALLOWABLE HEADWATER DEPTH = 0.3 FT. WHICH IS GREATER THAN REQUIRED
THEREFORE WEIR HAS CAPACITY

FREEBOARD FOR 100-YR = 0.52 FT.

Flow Velocity = 1.80 FPS (Less than 2.0 FPS OK)

*Rock Chute to be provided downstream of the spillway in accordance with the Soil Erosion and Sediment Standards.

EMERGENCY SPILLWAY CALCULATIONS

Bioretention/Detention Basin 2

o Spillway Capacity:

Spillway calculation based on weir equation: $Q = CLH^{3/2}$

'C' = weir coefficient: Use 2.61

Qmax through spillway = 85.8

Spillway designed to pass 100 year flow

100-year flow = 2.35 CFS HEADWATER DEPTH = 0.05 FT.

ALLOWABLE HEADWATER DEPTH = 0.5 FT. WHICH IS GREATER THAN REQUIRED THEREFORE WEIR HAS CAPACITY

FREEBOARD FOR 100-YR = 0.74 FT.

Flow Velocity = 0.56 FPS (Less than 2.0 FPS OK)

*Rock Chute to be provided downstream of the spillway in accordance with the Soil Erosion and Sediment Standards.

ANTI-SEEP COLLAR DESIGN CALCULATIONS

DYNAMIC ENGINEERING

Anti Seep Collar Design

Based on Standards for Soil Erosion and Sediment Control in New Jersey , July 2013

Project:	CSH Old Tappan	Computed By:	DRL
Job #:	1423-99-006	Checked By:	DTS
Location:	Old Tappan, NJ	Date:	3/1/2022
Basin Name:	Basin A		

The length of the seepage = $(L + 2 \cdot n \cdot V)$, where:

V = Vertical projection and minimum horizontal projection of the antiseep collar (ft)

L = Length (ft) of the conduit within the zone of saturation, measured from the downstream side of the riser to the tow drain or point where the phreatic line intercepts the conduit, whichever is shorter.

n = Number of antiseep collars

Note : Antiseep collars should be equally spaced along the part of the barrel within the saturated zone at distances of not more than 25 feet.

Proposed Anti Seep Collar

V = 1.00 feet
L = 38.00 feet
n = 3.00 collars

Collar spacing = 12.67 feet

Spacing is less than 25 FT, therefore design is OK

Length of seepage = 44 feet

Ratio of length of seepage to L = 1.158

Ratio is greater than 1.15, therefore design is OK

Therefore, use antiseep collars with min. vertical and horizontal projection of **1.00** feet and spacing of **13** feet.

SCOUR HOLE SIZING CALCULATIONS

SCOUR HOLE DESIGN

Project: CSH Old Tappan
 Job #: 1423-99-006
 Location: Old Tappan, NJ
 Design Storm: 100
 Computed By: GL
 Checked By: DRL
 Date: 8/30/2022

Discharge not in Basin, Therefore Tailwater is less than $0.5 \times D_o$

Discharge Point	Basin B
Q (100-yr storm cfs)	0.08
Inside Height of Outlet Culvert, D_o (in)	15
Inside Height of Outlet Culvert, D_o (ft)	1.3
Tailwater (ft), T_w	0.25
Length of Apron, L (ft)	3.75
Width of Culvert, W_o (in)	15
Width of Culvert, W_o (ft)	1.3
Width of Apron, W (ft)	2.50
Where $Y = 1/2 D_o$, Y (ft)	0.625
Median Stone Diameter, D50 (ft)	0.00
Where $Y = D_o$, Y (ft)	1.250
Median Stone Diameter, D50 (ft)	0.001

Note: Use D50 of 3 inches minimum

Equations used:

$$L = 3 \times D_o$$

$$W = 2 \times W_o$$

$$T_w = 0.2 \times D_o \text{ (If } T_w \text{ cannot be computed)}$$

$$\text{Where } Y = 1/2 D_o$$

$$D50 = (0.0125 / T_w) \times (q^{1.33})$$

$$\text{Where } Y = D_o$$

$$D50 = (0.0082 / T_w) \times (q^{1.33})$$

PLAN

SECTION A-A

- Notes:
1. The use of scour holes shall comply with county or local ordinances which would restrict the use of such devices due to the possible problems with mosquito breeding.
 2. No bends or curves at the intersection of the conduit and apron or scour hole will be permitted.
 3. There shall be no over fall from the end of the apron to the receiving material.
 4. The thickness of the riprap lining, filter, and quality shall meet the requirements in the Riprap Standard Section of the Standards for Soil Erosion Control in New Jersey.

BERGEN COUNTY LID CHECKLIST

APPENDIX H:

LOW IMPACT DEVELOPMENT (LID) CHECKLIST

Please fill out this checklist for identifying Low Impact Development Activities incorporated into the proposed land development.

Part 1 - Vegetation and landscaping

1. Has an inventory of existing site vegetation been performed? YES
If yes, was the inventory a factor in the site's layout and design? YES
2. Does the site utilize any of these non-structural LID-BMPs:
 - a. Preservation of natural areas: YES If yes, specify location WEST and % of site 27%
 - b. Use of native ground cover: YES If yes, specify location WEST and % of site 27%
 - c. Use of vegetated buffers: YES If yes, specify location WEST and % of site 27%
3. Specify percentage of total building roof area that will be vegetated: 0%.
4. How many trees will be planted on site? 167 How many deciduous 82 coniferous 85
How many trees will be removed? 203
How many *street* trees will be planted? 9 What types: ARMSTRONG RED MAPLE

Part 2 – Minimizing site disturbance

5. Have inventories of existing site soils and slopes been performed? YES If yes, were the inventories a factor in the site's layout and design? YES. Please explain PROPOSE TO SUPPLEMENT AND MAINTAIN EXISTING VEGETATION TO MAXIMUM EXTENT POSSIBLE
6. Explain how site disturbance will be minimized during construction phases
USE OF PROPOSED RETAINING WALLS TO MINIMIZE DISTURBANCE; WETLAND/VEGETATED AREA IS BEING PRESERVED
7. Specify the percent of site to be cleared: 72%. For buildings: 18%. For driveways 19%.
Specify % of site to be re-graded: 34%.
8. Specify the site's hydrologic soil group (HSG) percentages:
HSG A: 23% HSG B: 77% HSG C: _____ HSG D: _____
9. Specify percentage of each HSG that will be permanently disturbed:
HSG A: 100% HSG B: 57% HSG C: _____ HSG D: _____
10. Explain how site disturbance will be minimized within areas with greater permeable soils (HSG A and B) to maintain groundwater recharge rates and reduce stormwater volume increases.
THE ENTIRE SITE IS COMPRISED OF TYPES A AND B SOILS; OVERALL DISTURBANCE IS MINIMIZED

Part 3 – Impervious area management

11. Specify the following with regards to impervious coverage:
 - a. Maximum site impervious coverage (%) permitted by local regulations 30%
 - b. Existing (%) (pre-project) impervious coverage at the site: 2%
 - c. Proposed (%) impervious coverage for the site: 33%
 - d. Is the site designed to achieve minimum impervious coverage? YES
12. Specify percentage of parking area that will be porous: 0%. Please explain which site areas will be porous: _____
13. Provide the following with regards to the number of parking spaces:
 - a. The number of parking spaces required by local regulations for the development 42 (RSIS)
 - b. The number of parking spaces being provided 46
 - c. Is the site designed to minimize the number of parking spaces to reduce impervious surface? YES
14. Specify the following with regard to the size of parking stalls:
 - a. The size of parking spaces required by local regulations 10'X20'
 - b. The size of parking stalls being provided 10'X20'
15. Specify percentage of total parking area that will be:
 - a. Located beneath buildings 0
 - b. Within a multi-level parking deck 0
 - c. Only for compact cars 0
16. Specify the number of parking spaces provided for bicycle parking 0

Part 4 - Circulation Improvements

17. Explain how the project will impair or improve vehicular traffic flow? _____
NO REDUCTION IN LEVEL OF SERVICE FOR OLD TAPPAN ROAD
18. Provide the pre-project Level of Service (LOS) A Post-project LOS A

19. Explain how roadway safety and the pedestrian environment will be improved for each of the following:

- a. Placement and type of intersection signals N/A
- b. Pedestrian features PROP. CROSSWALK AND ACCESSIBLE RAMPS AT DRIVEWAY APRON IMPROVE EXISTING PEDESTRIAN FEATURES
- c. Sidewalk replacement PROP. CROSSWALK AND ACCESSIBLE RAMPS AT DRIVEWAY APRON IMPROVE EXISTING PEDESTRIAN FEATURES
- d. Access control PROPOSED STOP BAR AND SIGN AT ACCESS DRIVEWAY
- e. Aesthetic treatments ENHANCED LANDSCAPING ALONG OLD TAPPAN ROAD FRONTAGE
- f. Improved sight distance N/A
- g. Street and sidewalk lighting N/A
- h. Pedestrian- and bicyclist-activated signals N/A
- i. Landscaped planters N/A
- j. Bus pullout lanes and transit shelters N/A

20. Explain how bicycle use will be promoted for the development. Will bicycle accessories (bike racks, secure storage, showers, etc.) be provided? NO; NOT APPLICABLE FOR THE PROPOSED USE

21. Explain how public transit will be promoted for the development N/A

22. Will Transportation Demand Management techniques be provided? Please explain:

A PRIVATE VAN SERVICE WILL BE USED ON SITE TO TRANSPORT RESIDENTS IN GROUPS TO FURTHER REDUCE INDIVIDUAL TRIPS ON SITE

Part 5 – Source Control and Pollution Prevention

23. Specify number of outdoor trash receptacles provided 1. Number of recycling receptacles provided 0.

24. Is a recycling plan being submitted NO?

25. Identify stormwater management measures on the site that prevent discharge of large trash and debris.

PROPOSED ONSITE INLETS AND ABOVEGROUND BASINS WITH TRASH RACKS COLLECT RUNOFF AND PREVENT LARGE TRASH AND DEBRIS FROM LEAVING THE SITE

Part 6 – Energy and Environmental Control

26. Indicate what is being done to reduce the site's contribution to the urban heat island effect (i.e., light-colored/high albedo pavement surface with a minimum albedo of 0.3; use of porous pavement;

substantial increase of tree canopy) PROPOSED PAVEMENT IS MINIMIZED TO THE MAXIMUM EXTENT PRACTICABLE; PRESERVATION OF NATURAL AREAS IS MAXIMIZED

27. Will outdoor lighting fixtures be installed with energy-efficient fixtures in conformance with the Bergen County Land Development Regulations and as outlined by the International Dark Sky Association (IDSA) www.darksy.org to preserve and protect the nighttime environment? Please explain.

YES; FULL CUTOFF FIXTURES PROPOSED TO REDUCE GLARE AND LIGHT SPILLOVER

28. What percentage of the total electricity for the site will be from renewable sources? TBD. Please explain

Part 7 – Construction Materials

29. Is there a plan for the processing, transportation and disposal of waste? Provide a description of all material being disposed and location of disposal.

SOLID WASTE WILL BE STORED WITHIN AN ON-SITE TRASH ENCLOSURE AND WILL BE REMOVED REGULARLY BY LOCAL WASTE MANAGEMENT

30. What percentage of non-hazardous construction and demolition debris from the project will be recycled?

TBD Salvaged back into the site? TBD

Part 8 – Community

31. Explain how meaningful public input was incorporated into the project. Provide evidence of how community values (historic preservation, cultural, neighborhood preservation, environmental) were integrated into the design process.

THE APPLICANT IS WORKING CLOSELY WITH THE RESIDENTS OF THE TOWNSHIP TO MAKE ARCHITECTURAL DESIGN DECISIONS AND TO PROVIDE SITE FEATURES WHICH WILL MINIMIZE NEGATIVE IMPACTS TO THE ADJACENT LOT OWNERS.

32. Explain how the project is consistent with the Bergen County Master Plan

THE PROPOSED PROJECT FITS IN WITH THE CHARACTER OF THE NEIGHBORHOOD AND TOWNSHIP

Part 9 – Narrative

33. In narrative form, provide an overall description of the LID-BMP approach to stormwater management and strategies incorporated into the proposed site design. Attach additional pages as necessary.

THROUGH LIMITING THE PROPOSED DISTURBANCE TO THE AREA OF PREVIOUS DISTURBANCE, THIS PROJECT IS ABLE TO

PRESERVE NATURAL AREAS TO THE MAXIMUM EXTENT POSSIBLE. THE PROJECT ALSO PROPOSES TO MAINTAIN EXISTING

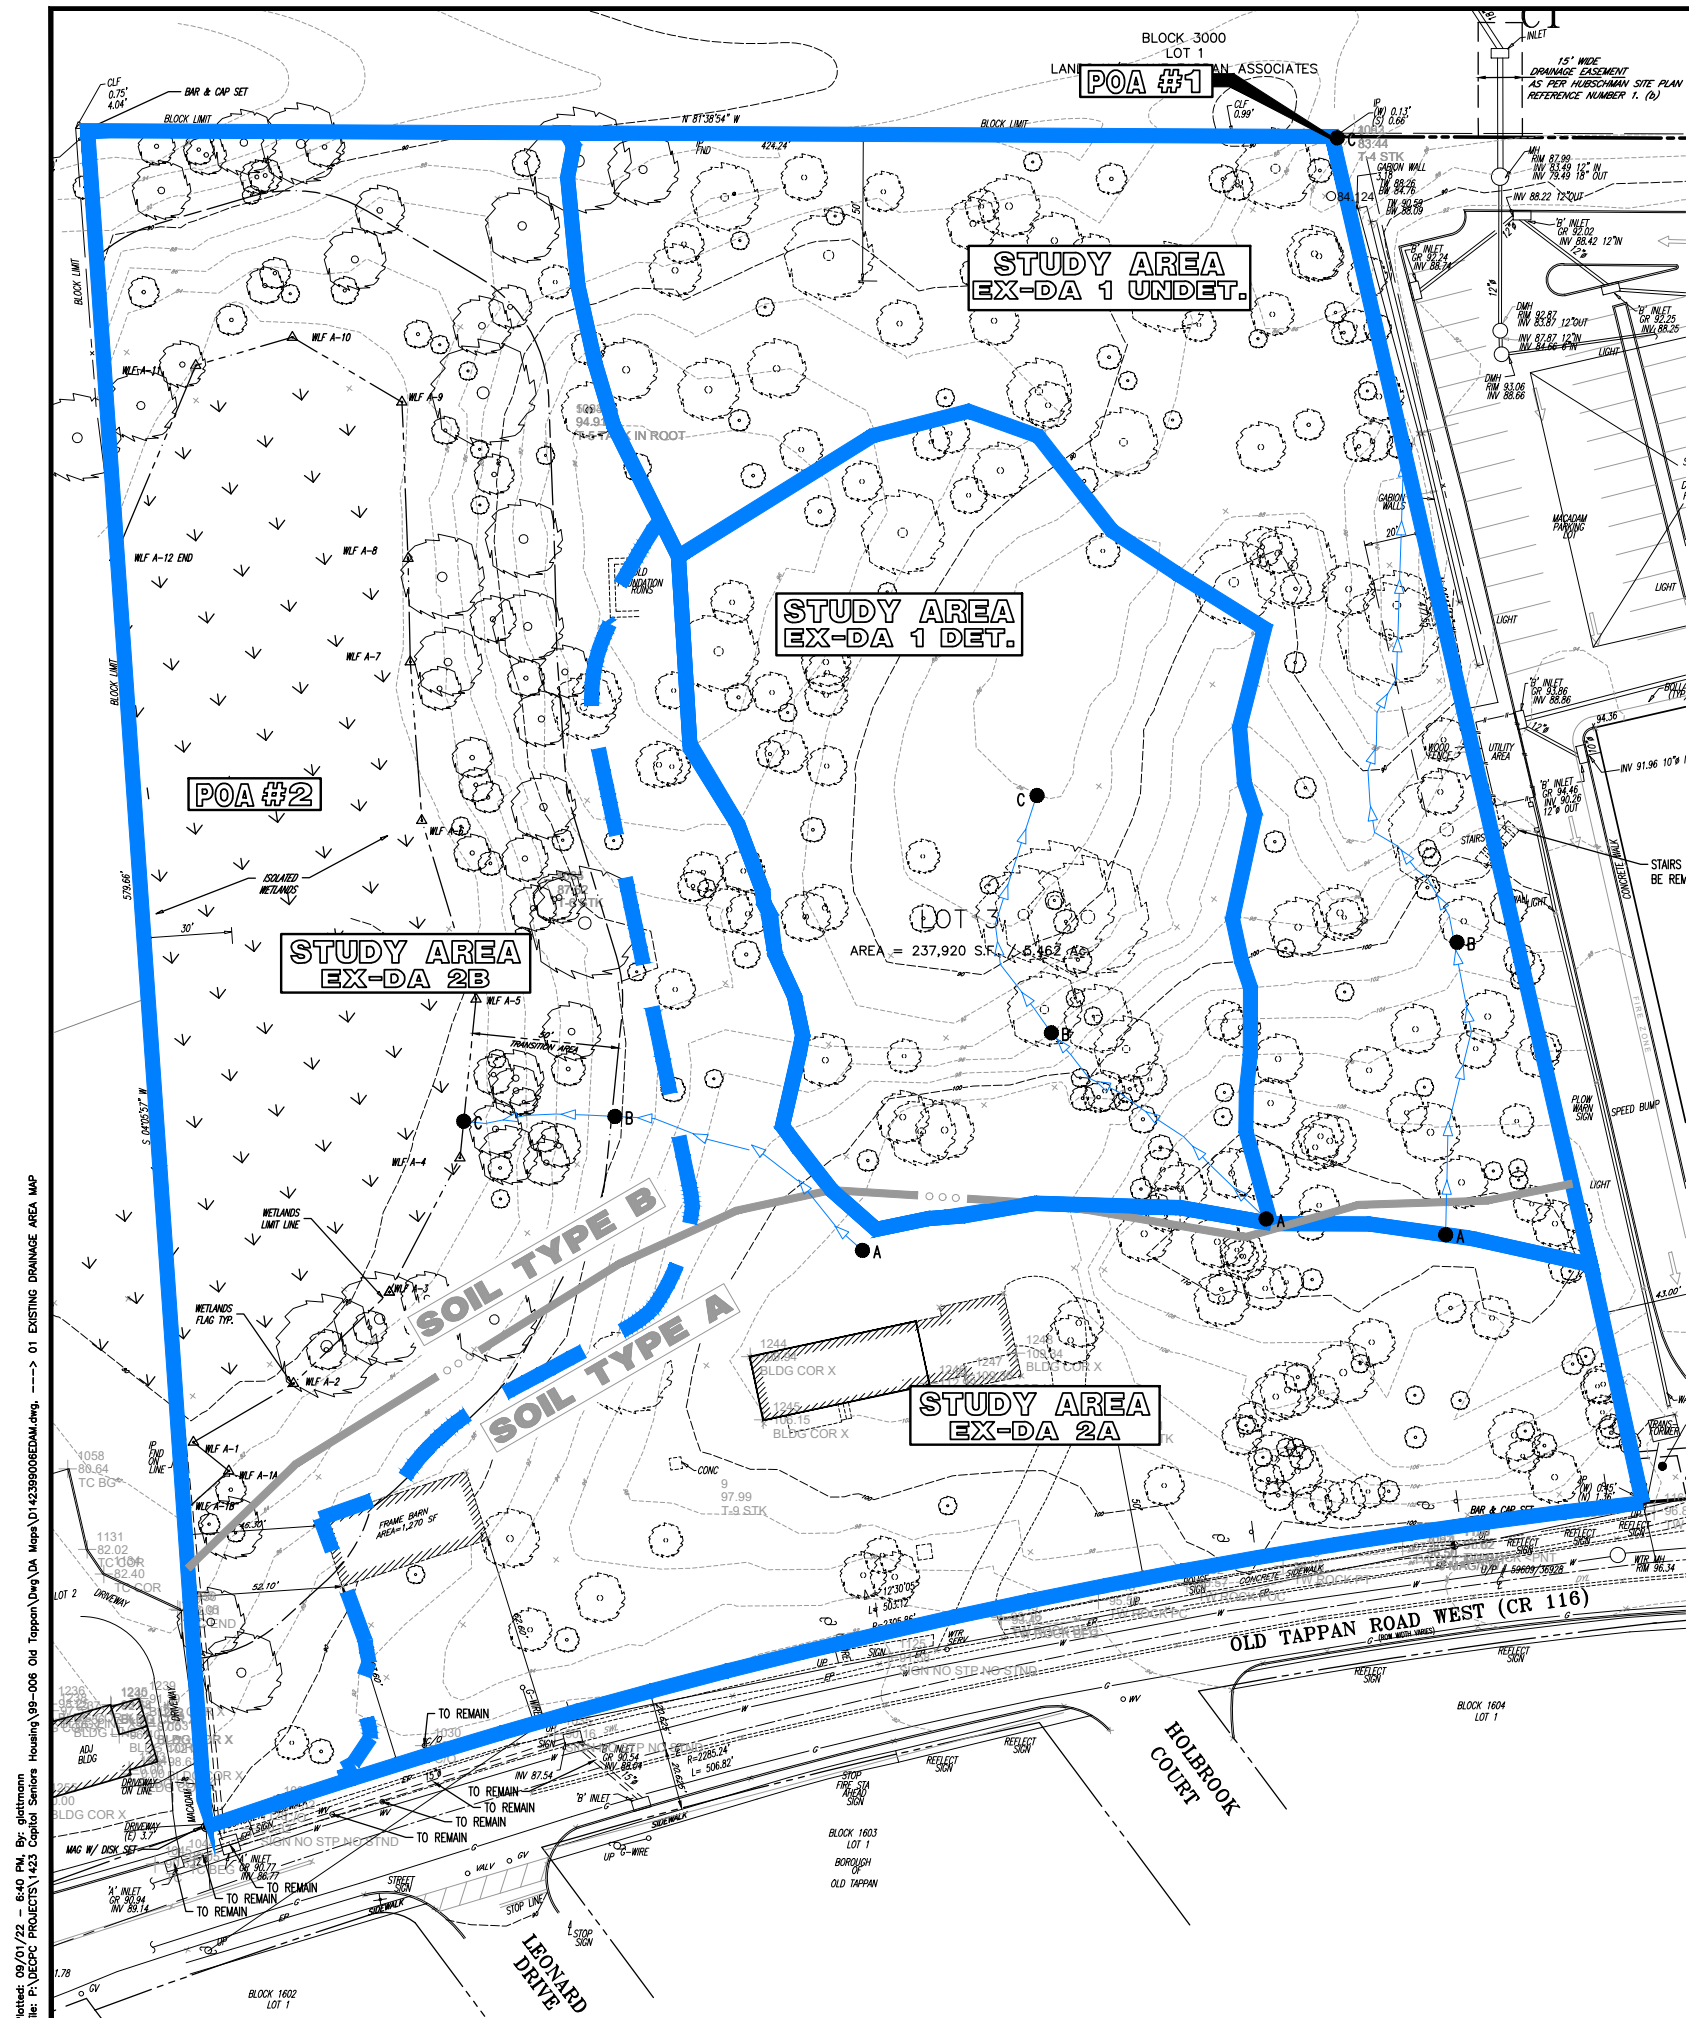

DRAINAGE AND GRADING CONDITIONS TO THE MAXIMUM EXTENT POSSIBLE.

Part 10 – Compliance with Non-structural Requirements of NJDEP Stormwater Management Rules

N.J.A.C. 7:8-5.3(b)

No.	Nonstructural Strategy	Yes	No
1	Protect areas that provide water quality benefits or areas particularly susceptible to erosion and sediment loss. <i>Please explain:</i> PROP. SCOUR HOLE AT THE DISCHARGE POINT DOWNSTREAM OF THE ABOVEGROUND BASIN	X	
2.	Minimize impervious surfaces and break up or disconnect the flow of runoff over impervious surfaces. <i>Please explain:</i> IMPERVIOUS SURFACES ARE MINIMIZED AND NATURAL/LANDSCAPED AREAS ARE MAXIMIZED	X	
3.	Maximize the protection of natural drainage features and vegetation. <i>Please explain:</i> EXISTING WETLANDS/VEGETATED AREA IS REMAINING UNDISTURBED	X	
4.	Minimize the decrease in pre-construction time of concentration. <i>Please explain:</i> EXTENSIVE LANDSCAPE PLAN TO PROVIDE SUPPLEMENTAL VEGETATION AND MINIMAL DISTURBANCE TO NATURAL AREAS	X	
5.	Minimize land disturbance including clearing and grading. <i>Please explain:</i> VEGETATED/WETLANDS AREA IS NOT BEING DISTURBED. PROPOSED RETAINING WALLS MINIMIZE DISTURBANCE FOR GRADING/CLEARING	X	
6.	Minimize soil compaction. <i>Please explain:</i> USE OF RETAINING WALLS MINIMIZES DISTURBED/COMPACTED SOILS	X	
7.	Provide low maintenance landscaping that encourages retention and planting of native vegetation and minimizes the use of lawns, fertilizers, and pesticides. <i>Please explain:</i> PLEASE REFER TO LANDSCAPE PLAN PREPARED BY LONGSTONE GARDENS.	X	
8.	Provide vegetated open-channel conveyance systems that discharge into and through stable vegetated areas. <i>Please explain:</i>		X
9.	Provide preventative source controls. <i>Please explain:</i> PROPOSED STORM DRAIN INLETS PREVENT LARGE DEBRIS FROM FLOWING INTO THE DOWNSTREAM CONVEYANCE SYSTEM	X
